Discover, Process, and Stream Your Data

AIRBUS

DataDoors

Discover, process, and stream your imagery and related geospatial data – anywhere, anytime

- Maximize the value of data within your organization
- Upload, access, and manage your content anytime from anywhere
- Find all the critical data related to a location in seconds
- Easily collaborate and share data across your organization
- Eliminate duplication of data purchases
- Reduce data management costs while increasing access and workflow efficiency

The challenge

Today, data is our most valuable resource, but in the vast digital sea, you need to be able to find the data you need, when you need it.

If your organization utilizes imagery and other geospatial data to accomplish your goals, you need a way to take control and get the most value out of your data.

The solution

DataDoors solutions enable you to manage vast archives of satellite, drone and aerial imagery, terrain data, maps, and additional content such as photos, videos,

and spreadsheets. In the cloud or behind your firewall, DataDoors can manage imagery and other data from multiple vendors as well as your own private collections.

Upload and manage your content anytime from anywhere

DataDoors saves time for everyone involved with handling imagery and related geospatial data. New functionality enables you to upload new data into the system from any device, automatically monitor storage locations for incoming new data, and manage and access data without software installation.

Access all your geospatial data

You'll have secure, single-point access to all your geospatial data, regardless of source, including satellite imagery, aerial imagery, UAV data, LiDAR, and unstructured data such as photos, videos, audio, and documents. DataDoors can manage all major raster and vector formats.

Search and discover

Allow everyone on your team to easily search your vast archives and quickly find needed information. Search your data geographically through a map interface. Take advantage of metadata in the catalogue through powerful search criteria such as date, resolution, cloud cover, and keywords.

Stream your data

Count on basic file delivery—clip, zip, and ship—or turn to increasingly popular streaming options.

Stream your data for visualization or analysis. Stream publicly or privately via OGC, Esri, and Google protocols.

Collaborate across the organization

Share result sets and projects. With an unlimited number of users, DataDoors is available to everyone within your organization as a branded and customizable solution. Set permissions through advanced user management tools. Automated data usage reports provide key business analytics.

Deploy your way in the cloud or behind your firewall

DataDoors can be hosted in the cloud for anytime, anywhere access for all users. Not only convenient, this means that processing and streaming are scalable. Users need not hassle with software installations.

For organizations preferring not to use the cloud, DataDoors can be installed on-premises behind your organization's firewall for extra security.
